HW2-3

Maedeh Karkhaneh Yousefi

February 25, 2022

I reckon a linear model, especially linear regression is the best model to fit the data. That's because the target is continuous. I used MinMaxScaler and OrdinalEncoder as a preprocessing procedure.

$egin{array}{c} { m Part} \ { m I} \\ { m Regression} \end{array}$

Linear Regression

The linear regression score is: 0.7296646657433239 (73 percent)

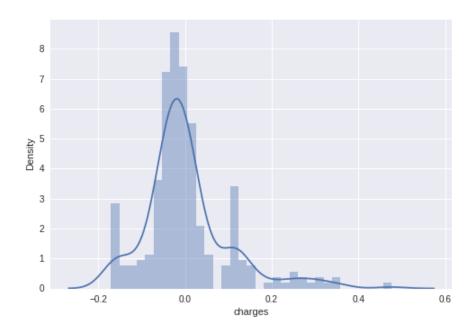

Figure 1: The distplot of prediction-ytest for charges. One can see 2 other peeks, which may show 2 more classes.

Linear Regression (Polynomial Features included)

The score is: 0.8199104895969911 (82 percent)

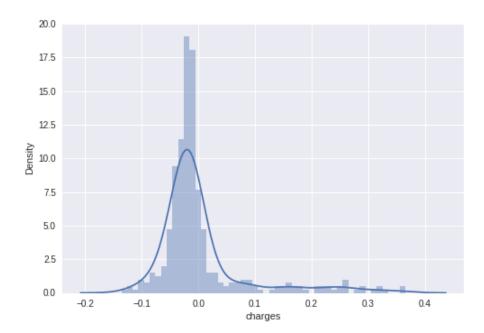

Figure 2: The distplot of prediction-ytest for charges. You can see that those other peaks are gone and most of the error is distributed over the range of -0.1 to 0.1.

SVR with Linear Kernel

The SVR (kernel = linear) is: 0.7110971727822234 (71 percent)

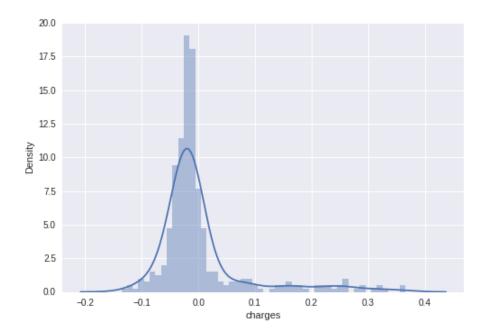

Figure 3: The distplot of prediction-ytest for charges. The results show a distribution of error between the range of -1 to -1, which was less for linear regression.

SVR with Poly Kernel

The SVR (kernel = poly) score is: 0.6842361729120802 (68 percent)

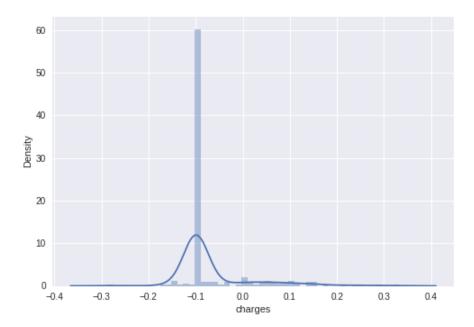

Figure 4: The distplot of prediction-ytest for charges. There is an obvious peak at -0.1, which shows that most of the data have an error of 0.1.

Random Forest Regressor

The score is: 0.8262341327080196 (83 percent)

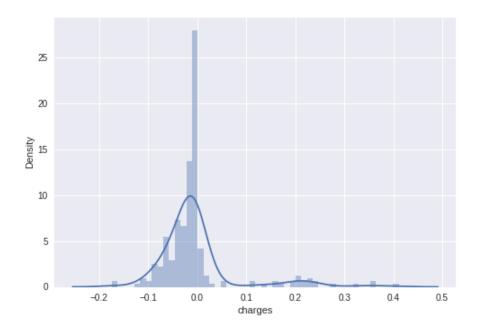

Figure 5: The distplot of prediction-ytest for charges. The errors are biased toward the left part of the plot.

 \mathbf{PCA} I used PCA for finding the two most important components in the models.

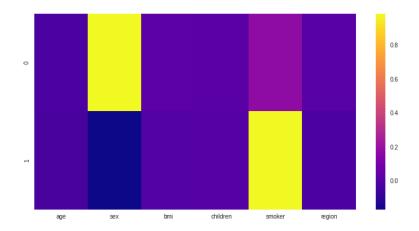

Figure 6: From the plot one can see that smoke and sex have the most effect on those two components.

KNN

I could only use KNeighborsClassifier after classifying 'charge' into 5 classes, each representing a range of 1000 values.

| | precision | recall | f1-score | support |
|--------------|-----------|--------|----------|---------|
| | | | | |
| | | | | |
| 0.0 | 0.86 | 0.96 | 0.91 | 221 |
| 1.0 | 0.72 | 0.74 | 0.73 | 103 |
| 2.0 | 0.71 | 0.34 | 0.46 | 35 |
| 2.0 | 0.71 | 0.54 | 0.40 | |
| 3.0 | 0.67 | 0.42 | 0.52 | 19 |
| 4.0 | 0.80 | 0.67 | 0.73 | 24 |
| | | | | |
| accuracy | | | 0.81 | 402 |
| accui acy | | | | |
| macro avg | 0.75 | 0.63 | 0.67 | 402 |
| weighted avg | 0.80 | 0.81 | 0.79 | 402 |
| | | | | |

The confusion matrix is:

| [[: | 212 | 9 | 0 | 0 | 0] |
|-----|-----|----|----|---|------|
| [| 26 | 76 | 0 | 1 | 0] |
| [| 9 | 12 | 12 | 1 | 1] |
| [| 0 | 8 | 0 | 8 | 3] |
| [| 0 | 1 | 5 | 2 | 16]] |
| | | | | | |

Part II Clustering

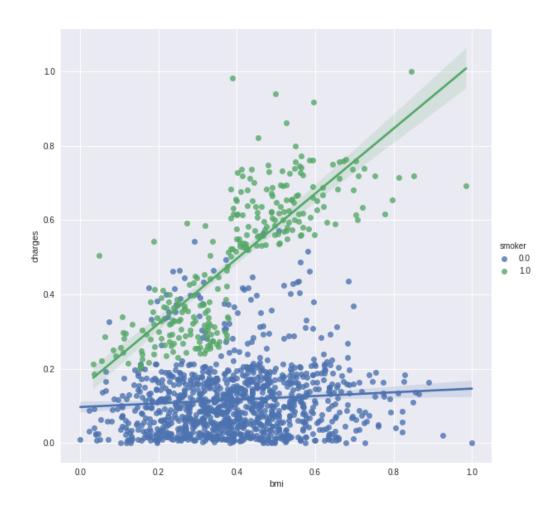

Figure 7: Charge-bmi lmplot with hue=smoker.
